Appendix 2: Prototype Interview Transcript

N: Hello, this is the prototype of the program which I have designed, after listening to your problems last interview. How is it?

A: Ok, overall this program really answers the problems that I've encountered. To clarify, in the tab 'add song', I have to insert all the songs manually right? It doesn't have any songs in there?

N: Yes.

A: I see… What if I want to insert more than one chord per bar?

N: Oh. I haven't thought of that yet.

A: Ok, next to the display section. I see that you can input the key for the song, but what if the song has more than one key? Another thing I would like to add to the display is "albums" and "countries" which would further help me sort through pieces of music.

N: Ok

A: Next, for the transpose tab, if possible I would want buttons to increase and decrease the key in addition to the current function. It would be easier to use. The chord progression tab seems good. Just fix the part about inserting chords in the section before, then it should be fine.

N: Ok

A: A function that I really want for this program would be compatibility with other devices like the IPad. Because, it would be more viable to use for a real performance. Also if this program can be online where other people can come in and see the songs I have analyzed, and likewise, I would be able to see theirs.

N: Is that all?

A: Yes

N: Thank you.
