Criteria E: Evaluation

Word count: 226

Success Criteria	Accomplished?
An outfit generator based on manual input of a number of factors[5]	Accomplished, my client is able to manually input things like weather, temperature, occasion, etc. to produce an appropriate outfit
With each iteration of the program, the output will produce 2 outfits[6] in order to give my client the option of personal preference, and display them in the words my client gives me that he would like them to be organized by[7].	Accomplished, my client is able to get 2 outfits which have listed each item of clothing they need, in the words they have labeled them.
Button which will place new clothes bought by my client into the chosen category of his virtual closet[8].	Accomplished, my client is able to input new pieces of clothing easily and effectively, and this addition is also transferred to the MySQL database.
Remove button to get rid of unwanted clothes in the clients closet[7].	Accomplished, my client is able to remove clothes from their closet easily, and this deletion is also transferred to the MySQL database.

Recommendation	Benefit	Why/how realistic?
When items are displayed in the closet table, put them into categories so they can more easily be found[9]	My client does not have to scroll through all the items in his closet to find something.	This is realistic. I would have to figure out how this would work with the MySQL connection, and then go from there. I think this is a very reasonable request.
A save outfit feature[10]	My client can easily find outfits he liked wearing instead of having to input data to get an outfit.	I think this would be a bit difficult, but doable. It is similar to the table of all clothing items already in the project, so, with a bit of tweaking and a little more mastery of MySQL, I think I could create this function for my client.
