Q1: Thank you for meeting with me again, I hope that you enjoyed what my product had to offer, and I understand that there are perhaps some things you didn't like about it. So I'd like to ask some questions to get your overall opinion. I remember you wanted flexibility in terms of deleting all your tasks or deleting just one task at a time, were you happy with the way that turned out?

A1: Yes, I think it was super helpful, and the overall layout was god.

Q2: Great. In our initial meeting, I remember how you wanted this to be an app with saveable data. Unfortunately this was not something I could create, as it required an extension program to code a database. How big of a deal is this to you?

A2: Well it would have been ideal to be able to save and reopen my information, however the application is still useful to me as it allows me to have a visual layout of my tasks, and organize them by different priorities, even though I cannot save.

Q3: I see. So it seems as if you were happy with the overall layout is you like the visual display, am I correct in assuming that?

A3: Yes, I mean it doesn't have to look crazy, and I appreciate the simplistic and structured layout of tabs, buttons and the table. It's kind of hard to say what was missing… perhaps more user-interaction in terms of explaining what buttons do…maybe with a hovering pop-up or something. I think the layout was well done though, not to discredit anything.

Q4: I see, thank you. Are there any other things we discussed in the initial prototype that you feel were not strongly present? And do you think it is for the better or worse?

A4: I do. I think that originally I would have liked to have been able to calculate the percentage completion of a task, and originally I wanted more searchability, however I don't actually see the need for that anymore. For one, when I'm searching for a task, I'll only really use the name to search for other attributes. I also think that because I am able to sort data, I don't necessarily need to be able to calculate a percentage completion. One or the other works for me.

Q5: Got it. I did put in some new things which I'm sure you were aware of… mainly to increase the user friendliness - the pop-up messages for example, but also the refreshing of text fields to provide a clean page for you to re-enter data in. How helpful was this?

A5: Super. I appreciate both the pop-up messages and the text clearing. The pop-ups allowed me to know that whatever action I took was actually registered by the program, and the text field clearing was just a feature that made things more efficient. So yes, it did enhance the usability.

Q6: Alright, that is good to hear. Thank you very much for letting me work with you to ultimately make the best version of a program for you.

A6: My pleasure!
